

## GOOD FOR ENTERPRISE

### THE CHALLENGE

Employees want mobile access to critical corporate email, calendar, contacts, and intranet from their personal mobile devices. IT wants to manage the influx of mobile devices and the corporate data on them while meeting user demands for mobile collaboration.

### THE SOLUTION

Good for Enterprise® securely manages data and devices. It is part of Good's Enterprise Mobility Management (EMM Suites) and accelerates day one productivity, offering the following benefits to enterprises:

#### Productivity and Collaboration

Good for Enterprise enables enterprise grade, secure mobile collaboration with secure email, calendar information, contacts details, browser access, task management and document data. It delivers an intuitive, consistent and tailored user interface across multiple devices on Android™, iOS and Windows™ Phone and Windows 8.1 Pro platforms. Mobile workers can now quickly search, read and compose emails; review documents; manage contacts and schedule meetings with colleagues using their preferred device. Good for Enterprise further integrates with Good-secured apps such as Good Share™, Good Connect™ and Good Access™ to extend desk-based collaboration to mobile devices, increasing user efficiency and productivity outside of the office.

#### Security and Data Loss Prevention

Good for Enterprise is built on Good's next-gen containerization, which enables secure data sharing between Good-secured apps as well as app-level encryption independent of the device used. With next-gen containerization, Good for Enterprise protects corporate data—including emails, business contacts, or files downloaded from corporate intranets—on personal unmanaged and managed devices. The data is encrypted and application and data access controls are applied within the secure container. This separates business data from employees' personal information and delivers consistent security across devices and OS versions. In the event a device is lost or stolen, business data can be wiped or locked without impacting personal data. Protection at the application level also prevents users from inadvertently leaking corporate data. For example, IT can prevent employees from opening files in unsecured apps, backing up business data to personal cloud-based services, or copying and pasting business content into consumer apps or personal email. Good uses patented end-to-end security that protects corporate data along each phase of delivery to all provisioned devices. Data transmitted over the air, and at rest on devices is secured with industry-leading FIPS-validated AES encryption. There is no need to change firewall settings or set up new inbound connections—all Good servers are deployed behind the firewall with a secure outbound connection using standard port 443. More importantly, Good's Network Operations Center verifies device compliance before devices are allowed to connect to Good's inside-the-firewall server.

For certain regulated industries, Good for Enterprise supports S/MIME, securing access to email through certificate-based authentication.

## Management & Control

Good for Enterprise helps accelerate mobility adoption by including integrated device and application management capabilities, giving you complete control over your mobile deployment. From a central, web-based console, you have full visibility of your entire device fleet. You can provision new devices; enforce security policies, and remote wipe enterprise data or the entire device from single location.

FEATURE	iOS	ANDROID	WINDOWS PRO 8.x	WINDOWS PHONE 8.x
