NetIQ Identity Tracking for Identity Manager

Introduction

Knowing who has access to what is vitally important in today's IT environment. Compliance mandates, regulatory requirements and security policies all require detailed access records. However, knowing who has access to what is only part of the picture. Knowing what people are doing with their access—both historically and in real time—is equally important. Inadvertently allowing non-compliant, malicious or improper behavior could result in hefty fines, failed audits and severe damage to your enterprise's information stores and business reputation.

NetIQ® Identity Tracking for Identity Manager™ combines the powerful information and provisioning capabilities of Identity Manager with a real-time correlation engine to give you a complete picture of who has access to what and what people are doing with their access. This user-activity monitoring and remediation solution works across all systems that Identity Manager provisions, significantly reducing the risks of non-compliant, malicious or improper behavior harming your enterprise.

Product Overview

NetIQ Identity Tracking for Identity Manager connects to Identity Manager and provides transparency into what users are doing with their access. Using powerful connectors and collectors, the Identity Tracking for Identity Manager correlation engine monitors and records all user activities in the systems that Identity Manager provisions, and evaluates these activities against policies you've established. If it detects non-compliant or suspicious activity, it can send real-time notifications and take automated actions—before the activities can seriously damage your enterprise or its business reputation. And because all access logs are tied to the identity information in Identity Manager, you have a clear picture of who performed the suspicious or non-compliant activity and can take corrective action.

By combining identity information with real-time monitoring and remediation, NetIQ Identity Tracking for Identity Manager allows you to accurately monitor all user activity, reducing the risks that non-compliant, malicious and improper behavior can cause failed audits, hefty fines and damage to your enterprise's information and systems.
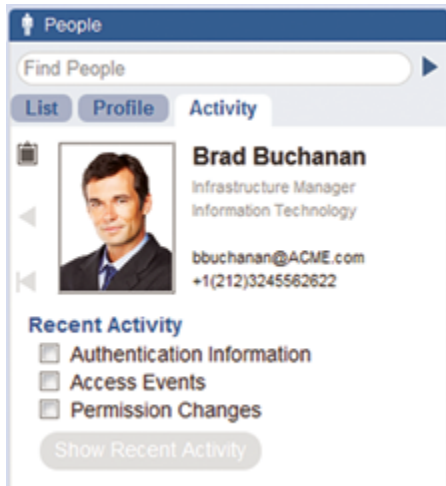

SOLUTION
Identity and Access
  Governance

PRODUCT
NetIQ® Identity Tracking for
  Identity Manager™

NetIQ Identity Tracking for Identity Manager monitors, reports and remediates user activities in systems that Identity Manager provisions.

Capabilities

- **User activity monitoring** – Monitor all user activity for non-compliant or suspicious actions in systems that Identity Manager provisions.

- **Real-time remediation** – Automatically take policy-based actions when improper behavior is detected.

- **Identity-infused security events** – Know who did what and when with access logs tied to Identity Manager identities.

- **Policy and compliance enforcement** – Automatically enforce policies and compliance mandates; shut down potentially harmful activity before it can do damage.

Features

- **Real-time monitoring and remediation engine** – Powered by industry-recognized technology, NetIQ Identity Tracking for Identity Manager monitors all user activity in your provisioned systems in real time.

- **Included connectors and collectors** – NetIQ Identity Tracking for Identity Manager ships with numerous connectors and collectors for commonly provisioned systems— with options for third-party connector and collector expansions.

- **Extensive reporting** – NetIQ Identity Tracking for Identity Manager leverages powerful Identity Manger reporting features, enabling you to generate extensive reports that can answer the toughest audit inquiries.

Key Differentiators

- **Real-time remediation** – Some systems can only monitor and report on user activity. NetIQ Identity Tracking for Identity Manager allows automated, real-time, policy-based user-access remediation.

- **Identity-infused events** – Some systems can monitor and remediate activities in real time, but lack the ability to tie activities to user identities. NetIQ Identity Tracking for Identity Manager provides reportable information about who committed the violation.
