

Zones drives successful results with integrated management solution

Enterprise mobility management (EMM) is becoming increasingly complex and time consuming as mobile and remote workers bring more mobile devices into your organization.

Zones experts guide you through deploying an EMM platform that addresses the costs, security risks, and management challenges associated with mobile adoption that traditional IT tools cannot address.

Take an integrated approach to telecom and mobility management

No matter where your company is in its mobility journey, you're juggling everything from deploying activated mobile devices and managing multiple carrier services to delivering secure email, apps, and content to mobile devices.

Zones can work with you to deploy an integrated telecom expense management (TEM) and mobile device management (MDM) solution that can help your organization achieve significant benefits – improved end user experience, impressive ROI, and unparalleled security.

Zones can also help you make a strong business case for IT spend. We'll show you how TEM delivers ample cost savings to fund an MDM solution.

Take control with proactive oversight of telecom

Organizations that use a telecom expense management (TEM) solution quickly gain visibility into their communications spend patterns and identify areas for short-term and long-term savings.

Zones offers CellManage™, powered by MOBI, which is designed to manage the entire lifecycle of telecom assets and services.

- > **Cost certainty and awareness** through comprehensive reports that analyze plans, user metrics, usage anomalies, and more
- > **Account visibility and control** of devices, carrier services, and users through a cloud-based software-as-a-service portal
- > **Automation** of procurement, service activation, user support, and device trade-in and decommission
- > **Streamlined deployment** by leveraging Zones partners with AT&T, Sprint, T-Mobile, Verizon, MobileIron, Apple, Cisco, Microsoft, and other mobility providers

Ensure seamless security and policy management

MobileIron mobile device management (MDM) is the foundation of a modern EMM solution that enables you to make employees productive on devices that they love to use, no matter where they're located.

For IT departments, MobileIron MDM helps ensure that security and compliance requirements are in place to protect important corporate data no matter the type of mobile device, and regardless of whether they are corporate- or user-owned.

Zones integrates MobileIron MDM with backend enterprise IT systems to meet the expectations of end users and IT departments.

- > **Secure** deployment and management of mobile devices, and selective management of business and personal data on devices
- > **Consistent role-based policies** across different operating systems and selective management of business and personal data
- > **Quality user experience** protected by a transparent security layer that ensures automatic yet invisible corporate data protection

Embrace mobility with help from Zones

Zones mobility experts are ready to guide you through TEM and MDM deployments that will give you a complete set of mobility management tools and services that increase visibility, reduce costs, and preserve corporate data.

Ask Zones how the cost savings from your TEM solution can fund a MobileIron MDM solution.
